

SPECIFICATION

TO ALL WHOM IT MAY CONCERN:

BE IT KNOWN THAT I, HIROSHI SHIBATA, a  
citizen of Japan residing at Kanagawa, Japan have  
invented certain new and useful improvements in

SYSTEM FOR REPORTING STATUS OF AND OFFERING SERVICE  
TO AN IMAGE COMMUNICATION TERMINAL

of which the following is a specification:-

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention generally relates to a system for reporting status of and offering service to an image communication terminal, and particularly relates to such a system which can report statuses of an image communication terminal to a manager via a service center and can offer various services from the service center to the image communication terminal. The image communication terminal may be a photocopier, a facsimile device, a printing device or a complex device having information communication means via a network.

2. Description of the Related Art

Occasionally, an image communication terminal such as a photocopier, a facsimile device, a printing device and a complex device requires maintenance and replenishment of consumables. When there is a failure of one or more of the resources of the image communication terminal or there is a shortage of consumables such as toner, the user of the image communication terminal calls the service center to ask for maintenance by a service-person or for replenishment of the consumables.

Japanese laid-open patent application No. 2-51968 discloses a system for dealing with a case of

shortage of the consumables such as toner. The user registers consumables under his possession into a list of consumables and when there is a shortage of the listed consumables, the user reports the registered list of consumables and information related to his terminal (e.g., telephone number) to the service center through facsimile communication so as to request for replenishment of the consumables from the service center.

Japanese laid-open patent application No. 7-170357 (Japanese patent No. 2744768) discloses a system for requesting maintenance by a service-person. When maintenance by a service-person is required due to an event such as a failure of a particular component of the image communication terminal, details of the failure is reported to the service center by a facsimile transmission.

Recently, there is a device such as an Internet facsimile for communicating documents by e-mails (electronic mails) on the Internet. Japanese laid-open patent application No. 10-207304 discloses a system for requesting replenishment of consumables and maintenance through Internet facsimile communication.

In this system, when a shortage of the consumables is detected, information reporting the shortage status is sent to a preregistered address by an

e-mail. If the status of shortage becomes more serious and the consumables are still not replenished, the e-mail is retransmitted with a higher emergency level. When the device recovers from a shortage state, an e-mail reporting this is sent to the preregistered address.

Also, with this system, when a status requiring the service-person is detected, an e-mail is sent to a first address of a plurality of registered service center. If the status is not recovered within a certain period of time, an e-mail is sent to the next address. When the repair is completed, an e-mail reporting the completion of the repair is sent.

However, with such image communication terminal of the related art in which replenishment of the consumables and maintenance of the resource is reported, a replenishment request or a service-person call is made directly to the service center and not via a manager (person-in-charge of management of the company) managing the image communication terminal. Therefore, even if there are consumables stocked by the manager, the consumables may be delivered to the user of the image communication terminal from the service center without the manager knowing it, or, the service-person may visit the user for maintenance of the image communication terminal without the manager knowing it.

SUMMARY OF THE INVENTION

Accordingly, it is a general object of the invention to provide a system for reporting status of  
5 and offering service to an image communication terminal, which can obviate the problems described above.

It is another and more specific object of the present invention to provide a system for reporting status of and offering service to an image communication  
10 terminal in which when an e-mail reporting the information of the image communication terminal is sent from the image communication terminal to the service center, various information corresponding to the status report is reported from a WEB-site of the service center  
15 to the manager, thereby improving user-convenience by enabling the manager to readily know the status of the image communication terminal on the homepage and reducing service cost for the image communication terminal.

20 According to the present invention, there is provided a system for reporting status of and offering service to an image communication terminal, which system includes:

an image communication terminal; a manager  
25 personal computer connected to the image communication

terminal via a network; and a service center connected to the image communication terminal via the network;

the image communication terminal including a registering part for registering an e-mail address of the manager, an e-mail address of the service center and identification information of the image communication terminal; an e-mail controlling part for exchanging e-mails via the network; and a status detecting part for detecting statuses of the image communication terminal.

10 The service center receives and registers the identification information and the e-mail address of the manager from the image communication terminal.

When statuses of the image communication terminal detected by the status detecting part are sent from the image communication terminal to the service center by the mail controlling part using an e-mail, various information corresponding to the statuses are informed to the manager through a WEB (World Wide Web) site of the service center.

20 With the above system, when an e-mail reporting an information of the image communication terminal is transmitted from the image communication terminal to the service center, various information corresponding to the status is sent to the manager from the WEB-sit of the service center. Thus, the manager

can easily know the status of the image communication terminal on the homepage. Therefore, the manager informs the state of the image communication terminal to the service center by referring to the homepage and can  
5 give appropriate handling corresponding to the state of the image communication terminal. As a result, convenience for the user (the manager and the user of the image communication terminal) can be improved while reducing the service cost for the image communication  
10 terminal.

#### BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a block diagram showing a system configuration of an embodiment of a system for reporting status of and offering service to an image communication  
15 terminal.

Fig. 2 is a diagram showing an example of how image communication terminal information, manager information and service center information are  
20 registered according to an embodiment of the present invention.

Fig. 3 is a flowchart showing reporting process of consumables and service maintenance of an embodiment of the present invention.

25 Figs. 4A and 4B are flowcharts showing a

process performed when the service center receives an e-mail from the image communication terminal.

Fig. 5 is a flowchart showing a process preformed when the manager receives an e-mail from the service center.

Fig. 6 is a diagram showing a screen display of the image communication terminal in a toner shortage state and an example of an reporting e-mail format from the image communication terminal to the service center.

Fig. 7 is a diagram showing a screen display of the image communication terminal in a heater failure state and an example of an reporting e-mail format from the image communication terminal to the service center.

Fig. 8 is a diagram showing an example of an reporting e-mail format from the service center to the manager, which is sent in a toner shortage state.

Fig. 9 is a diagram showing an example of an informing e-mail format from the service center to the manager, which is sent in a heater failure state.

Fig. 10 is a diagram showing details of displayed information on the HP represented by the URL in the toner shortage state.

Fig. 11 is a diagram showing details of displayed information on the HP represented by the URL in the heater failure state.

Fig. 12 is a diagram showing details of displayed information on the HP represented by the URL which is displayed based on counter data.

5 DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

In the following, principles and embodiments of the present invention will be described with reference to the accompanying drawings.

10 Figs. 1 to 12 are diagrams showing an embodiment of a system of the present invention for reporting status of and offering service to an image communication terminal. The present embodiment may be applied to a complex machine capable of sending/receiving data via e-mail and facsimile  
15 communication, a photocopier, a printing device or an Internet facsimile. However, an Internet facsimile will be taken as an example in the following description.

20 Firstly, the configuration of the system of the present invention will be described. Fig. 1 shows an Internet facsimile 1 serving as an image communication terminal. The Internet facsimile 1 includes a facsimile main control part 2, a registration part 3, a consumables status detecting part 4, a service maintenance status detecting part 5, a facsimile  
25 communication control part 6, a PSTN (Public Switched

Telephone Network) control part 7, an electronic mail (e-mail) data generating part 8, a LAN (Local Area Network) control part 9, an electronic mail (e-mail) control part 10. All of the elements shown by reference  
5 numerals 2 to 10 are connected by a bus 11.

The LAN control part 9 is connected to a manager PC (Personal Computer) 13 via a LAN network 12 which is connected to the Internet 14.

Also, the Internet 14 is connected to a PC 16  
10 of another user and to an Internet facsimile 17 via a LAN network 15. The Internet 14 is also connected to a service center provider (hereinafter referred to as a service center) 18. The service center 18 is connected to the PSTN control part 7 of the facsimile 1 via the  
15 PSTN (Public Switched Telephone Network) 19.

With the system of the present embodiment, the facsimile 1 and the manager PC 13 perform e-mail communication via a mail server (not shown) provided on the LAN network 12. The manager PC 13 performs e-mail  
20 communication via the Internet 14 and the facsimile 1 and the service center 18 perform e-mail communication via the PSTN 19.

Note that the e-mail communications between the manager PC 13 and the service center 18 are  
25 implemented in a known manner. That is to say, SMTP

transmissions and POP3 receptions are performed with the mail server provided on the LAN network 12.

Also, there may be a plurality of manager PCs. This is because there may be a plurality of managers in the office who are in charge of managing the facsimile 1.

On the other hand, the facsimile main control part 2 includes elements such as a CPU (Central Processing Unit), a ROM (Read Only Memory), a RAM (Random Access Memory), a DCR (Data Compression and Reconstruction) scanner, a plotter, an image memory and an operation display part.

The facsimile main control part 2 controls the facsimile 1 such that the facsimile 1 performs a sequence as a facsimile and also other various processes such as a replenishment reporting process of consumables such as toner, a maintenance reporting process of a resource such as a heater, an e-mail handling process for transmitting a toner replenishment request and an e-mail handling process for transmitting a service-person maintenance-failure request order.

A control process program executed by the CPU is stored in the ROM installed in the facsimile main control part 2. In the present embodiment, programs for performing a consumables-replenishment request informing process and a resource maintenance-failure status

informing process are also stored in the ROM.

The RAM can temporarily store various data required for the CPU to execute the control process program and serves as a work area of the CPU.

5           The DCR is provided for reducing time and improving efficiency of transmission of image information. The DCR compresses (encodes) image information upon transmission and reproduces (decodes) encoded image information to the original information  
10 upon reception.

A scanner may be an image scanner utilizing elements such as CCDs (Charge Coupled Devices). The scanner scans the original according to an instruction from the CPU and reads an image data of the original at  
15 a predetermined resolution.

The plotter part may include a recording device of an electrophotography type provided with a photosensitive drum or toner. The plotter part records the received image data on a recording paper.

20           The image memory accumulates images read by the scanner or images received.

The operation display part includes a liquid crystal display and various operation keys such as an operation key for performing various operations upon  
25 facsimile transmission, an operation switch for

inputting various information (such as an e-mail address) related to e-mails, an indicator part for displaying a toner empty indication when replenishment of consumables such as the toner is required and an  
5 indicator part which emits light when there is a need for maintenance or there is a failure of a resource such as a heater.

The registration part 3 stores e-mail address of the manager PC 13 as shown in Fig. 2, and thus serves  
10 as manager registration means. The registration part 3 also stores e-mail address and facsimile number of the service center 18 where consumables can be ordered from, and thus serves as service center registration means.

The registration part 3 also stores serial  
15 number, an e-mail address, a facsimile number and a caller ID information (terminal identification information including TTI (Transmitter Terminal Identification) information of the facsimile and the telephone number), and thus serves as identification  
20 information registration means.

The registration part 3 also stores order detail information related to the service center 18. The order detail information may include data such as type of toner, content of the service and status (toner-  
25 near-empty, etc.)

The consumables status detecting part 4 includes, for example, a remaining toner detecting sensor which detects an amount of the remaining toner and outputs a signal to the facsimile main control part

- 5 2. In the present embodiment, the consumables status detecting part 4 serves as status detecting means and consumables detecting means. The consumables are not limited to toner but may be any other article that is consumable.

- 10 The service maintenance status detecting part 5 may include a detector for detecting the status of a heater for heating a fixing roller for fixing a toner image onto a recording sheet, such as a sensor for detecting a voltage value of the heater. The service
- 15 maintenance status detecting part 5 outputs signal to the facsimile main controlling part 2 when the voltage value of the heater is not within a certain range. In the present embodiment, the service status detecting part 5 serves as maintenance/failure detecting means.

- 20 The facsimile communication control part 6 performs the facsimile communication conforming to G3-protocol, since the facsimile 1 of the present embodiment is a G3-facsimile.

- The PSTN control part 7 connects the facsimile
- 25 1 to the PSTN, and has an automatic call send/receive

function.

The e-mail data generating part 8 generates data of an e-mail such that various information or templates registered in the registration part 3 or data  
5 of the original text scanned by the scanner is generated as e-mail data.

The LAN control part 9 connects the facsimile 1 to the LAN network 12 so as to provide a predetermined protocol between the manager PC 13 and the service  
10 center 18.

The e-mail control part 10 sends the e-mail generated in the e-mail data generating part 8 to the mail server via the LAN control part 9 by SMTP transmission. E-mails informing about the consumables  
15 and e-mails informing about maintenance/failure of the resource are sent to the mail server by SMTP transmission. In the present embodiment, the e-mail control part 10 serves as e-mail control means.

On the other hand, the service center 18 is a  
20 general service provider which 18 enables an e-mail service and a WEB-service on the Internet 14. The service center 18 also has a function of offering individualized homepages to the user by inputting personal information of the user (manager e-mail address,  
25 etc.,) using a main home page (hereinafter referred to

as HP). The service center 18 can also be used to order products through a HP.

That is to say, the service center 18 includes terminal identification information and consumables  
5 information of the relevant terminal and is provided with means for introducing on the HP the consumables of the facsimile 1 provided at the user, means for the user to order consumables through the HP and means for informing on the HP the delivering time and date of the  
10 consumables. The service center 18 is also provided with means for introducing on the HP the terminal identification information of the facsimile 1, failure information or maintenance information of the relevant facsimile 1, information indicating time and date when  
15 the service-person is available and information related to new-product guide information. These means can be optionally set by a program software.

In the present embodiment, when the identification information registered in the registering  
20 part 3 and an e-mail address of the administrator is sent to the service center 18 upon installation of the facsimile 1, information related to the manager and the facsimile 1 are registered at the service center 18.

When the consumables status detecting part 4  
25 and the service maintenance status detecting part 5

detect the status of shortage of the consumables or the status of the maintenance/failure of the facsimile 1 and when this is informed by an e-mail generated at the e-mail data generating part 8, the facsimile main control  
5 part 2 informs various information corresponding to the status information to the manager PC 13 via the WEB (World Wide Web) site of the service center 18.

E-mails or facsimile information on the Internet 14 may be other possible means for receiving  
10 information on the service center 18. The content of such information can be automatically identified if the information has a specific format for informing the status of consumables of the status of service maintenance/failure information of the facsimile 1.

15 The various information is informed from the service center 18 to the manager 13 by an e-mail attached with a URL (Uniform Resource Locator) of the HP to the manager. Thus, it is possible to know the status of the facsimile 1 on the HP by accessing the WEB-site  
20 using the URL obtained from the manager PC 13.

This HP can be used for introduction and ordering of the consumables and also includes the terminal identification in formation of the facsimile 1, failure information or maintenance information of the  
25 relevant facsimile, the information indicating time and

date when the service-person is available and  
information related to new-product guide information.

When an operation such as replenishment of the  
toner or maintenance/repair of the heater is complete  
5 and an e-mail informing the completion is sent from the  
facsimile to the service center 18, the service center  
18 deletes the messages on the HP which have been  
informed from the manager PC 13.

In the present embodiment, the facsimile main  
10 control part 2 and the LAN control part 9 serve as  
communication means.

Referring now to the flowcharts shown in Figs.  
3 to 5 and information messages illustrated in Figs. 6  
to 12, the operation of the present invention will be  
15 described.

Firstly, an operation carried out when the  
status of the toner of the facsimile 1 is at a near-  
empty and when there is a failure of the heater and thus  
a service maintenance is required will be described.

20 In Fig. 3, in accordance with the results  
obtained from the consumables status detecting part 4  
and the service maintenance status detecting part 5, it  
is determined whether there is a change of the  
consumables status and the service maintenance status  
25 (step S1).

If the near-empty status of the toner is detected in accordance with the detection information from the consumables status detecting part 4, it is determined whether data such as terminal identification  
5 information, manager information and service center information have been registered (step S2). If such data have been registered, an e-mail for informing the fullness status of the consumables to the service center  
18 is sent based on the data of the service center  
10 information (step S3). Then the toner-near-empty status is displayed on the display part of the facsimile main control part 2 as shown at the top of Fig. 6 (step S4).

As shown in Fig. 6, the e-mail includes information such as service maintenance information,  
15 counter information, user information and terminal information. This e-mail is generated at the e-mail data generating part 8, subjected to an e-mail sending process at the e-mail controlling part 10 and then sent to the mail server by an SMTP transmission via the LAN  
20 control part 9.

Referring again to Fig. 3, if the result of step S1 shows that maintenance of the heating roller is required in accordance with the detection information from the service maintenance status detecting part 5, it  
25 is determined whether data such as the terminal

identification information, the manager information and service center information have been registered (step S5). If the data are registered, an e-mail informing the service maintenance status is sent to the service center 18 in accordance with the data such as the terminal identification information, the manager information and service center information (step S6). Then, it is determined whether the data should be displayed by the display part of facsimile main control part 2 (step S7). When it is necessary to display the data, a maintenance/repair mark is displayed as shown in Fig. 7 (step S8).

The e-mail generated here as shown in Fig. 7 is similar to that of Fig. 6 except that the line indicating "SERVICE CALL: HEATER ERROR" is different from what is shown at the lower part of Fig. 6.

Then, the processes performed at the service center 18 will be described with reference to the flowchart shown in Figs. 4A and 4B.

In Fig. 4A, it is determined whether the service center 18 has received an e-mail from the facsimile 1 (step S11). If the result is YES, it is determined whether the e-mail informs the shortage of the consumables (step S12). If the result is YES, the database is searched based on this e-mail to retrieve

information such as user-destination information, URL of the user-specific HP, user terminal type, consumables type, user-destination offering price and delivering time and date (step S13). Then the e-mail attached with  
5 the URL (see Fig. 8) is sent to the manager PC 13 (step S14). It is to be noted that all or part of such operations may be performed automatically.

If it is determined in step S12 that no e-mail related to the shortage of consumables has been received,  
10 it is determined whether an e-mail is received which indicates that service maintenance is required (step S15). When the result is YES, the database is searched based on this e-mail to retrieve information such as user-destination information, URL of the user-specific  
15 HP, user terminal type, error code type, user-destination service maintenance contract information and name of the person-in-charge at the user destination.

In the present embodiment, the user-destination information related to the device where  
20 there is a heater error is informed to person-in-charge of the service and these information messages are written into the user-specific HP (step S16). Then, an e-mail attached with the URL (see Fig. 9) is sent to the manager. It is to be noted that all or part of such  
25 operations may be performed automatically.

If it is determined in steps S12 and S15 that the e-mail does not indicate the toner-near-empty status or that there is a need for a maintenance of the heating roller, a normal e-mail process is performed (step S17).

- 5 If it is determined in step S11 that the e-mail is not from the facsimile 1, a normal e-mail process is performed (step S18).

Referring now to Fig. 5, the processes performed by the manager PC 13 will be described.

- 10 In Fig. 5, it is determined whether the e-mail with the URL has been received from the service center 18 (step S21). If it is not an e-mail with URL, a normal e-mail process is performed (step S22).

- 15 If it is determined in step S21 that an e-mail with URL has been received, the manager reads this e-mail and accesses to the HP indicated by the URL (step S23). If this HP shows a screen as shown in Fig. 10, it is determined that there is a shortage of the toner (branch YES from step S24), and thus the shortage of the consumables of the facsimile 1 can be recognized while  
20 the user is at his desk.

- When ordering the consumables based on the screen shown in Fig. 10, the user may check his stock of the consumables, replace or replenish the consumables,  
25 check the necessity of making an order of the

consumables, check the delivering time and date and makes an order of the consumables on the HP, if necessary (step S25).

5 If it is determined in step S24 that the e-mail is not guidance information of the consumables, an HP indicated by the URL is accessed (step S26). If this HP shows a screen as shown in Fig. 11, the failure of the heating roller of the facsimile 1 can be recognized while the user is at his desk (branch YES from step S26).

10 Then, in order that a guidance is given by the HP, not the handling manual, about the fact that there is no influence on the transmitting operation, that the received document can be transferred and about the handling, the manager orders for the heating roller on  
15 the HP (step S27), and terminates the process. This HP can be used for checking the service maintenance fee.

If it is determined in steps S24 and S26 that the e-mail is not guidance information of consumables or not guidance information of service maintenance, when a  
20 screen as shown in Fig. 12 is displayed, operations such as accessing to information such as new-product information, catalog request and ordering are performed and the process terminates. This screen shows an HP which is informed to the manager PC 13 when information  
25 is sent by an e-mail from the WEB-site when introducing

new-products based on counter information of the facsimile 1 and information indicating time-period elapsed since the date of installation of the terminal.

At the service center 18, the above-mentioned  
5 various screens are referred to and a catalog ordering process (ordering of the heating roller), a consumables ordering process and other service request processes are performed as shown in step S31 of Fig. 4B.

After these processes, when the toner is  
10 correctly set at the facsimile 1, the toner replenishment indication of the operating part of the facsimile main control part 2 is deleted and a normal standby indication is displayed. Also, an e-mail informing the recovery from the service maintenance  
15 status is sent to the service center 18.

At the service center 18, when the e-mail informing the recovering is received at steps S11 and S12, the messages on the HP are cleared and the process is terminated.

20 When replacing the heating roller, the service-person calls the user of the facsimile 1 and then visits and repairs the facsimile 1. After the repair is completed, the service maintenance status detecting part 5 performs a transition from a service  
25 maintenance necessary state to a service maintenance

complete state. The display indication of heater failure is deleted and returns to a normal standby display and an e-mail is sent to the service center 18 to inform that the heater-failure state has been  
5 recovered.

At the service center 18, when an e-mail informing the recovery is received at steps S11 and S15, the messages on the HP are cleared and the processes are terminated.

10 In the present embodiment, an Internet facsimile device having an e-mail function is taken as a terminal-side device. However, information transmission from the service center to the manager can be achieved by the normal G3 facsimile device if the state of the  
15 information communication terminal is informed to the service center via the PSTN network.

Thus, according to the present embodiment, when an e-mail informing the information of the facsimile 1 is sent from the facsimile 1 to the service  
20 center 18, various information corresponding to the status information can be informed from the WEB site of the service center 18 to the manager PC 13. Accordingly, the manager can easily know the status of the facsimile 1 on the HP. Therefore, the manager informs the state  
25 of the facsimile 1 to the service center by referring to

the homepage and can give appropriate handling  
corresponding to the state of the facsimile 1. As a  
result, convenience for the user (the manager and the  
user of the facsimile 1) can be improved while reducing  
5 the service cost for the facsimile 1.

Also, in the present embodiment, various  
information from the service center 18 is informed to  
the manager PC 13 by an e-mail with URL of the homepage  
which is sent to the manager. Therefore, the manager  
10 can be aware of the fact that there is some change of  
the status of the facsimile 1 by an e-mail sent from the  
service center 18 and can also know and deal with the  
status of the facsimile 1 by accessing the homepage  
using the URL of the homepage sent to the manager.

15 Since the shortage status of the consumables  
of the facsimile 1 is reported as the status information  
of the facsimile 1 reported from the service center 18  
to the manager PC 13, the manager can easily check the  
shortage status on the homepage and make an order.  
20 Therefore, it is possible to prevent directly ordering  
further consumables from the service center 18 while  
there are still some consumables in stock. Therefore,  
excessive cost can be reduced and the manager can deal  
with the ordering of the consumables as budgeted.

25 The service center 18 is configured such that

it introduces the terminal identification number of the facsimile 1 and information related to the type of consumables specific to the device and when the user orders the consumables on the HP, time and date of delivery of the consumables is informed on the HP. Accordingly, the manager can order lacking consumables of the facsimile 1 on the HP. Therefore, the manager can order the consumables as budgeted and the service cost can be reduced.

Also, as status information of the facsimile 1 reported from the service center 18 to the manager PC 13, the maintenance/failure status of the facsimile 1 is reported from the service center 18 to the manager. Accordingly, the manager can easily check the maintenance/failure status on the HP and deal with it. Therefore, the manager can be aware of the maintenance/failure status of the facsimile 1 in real-time, and thus unnecessary checking of the maintenance/failure status between the manager and the facsimile 1 can be avoided.

Also, the service center 18 is configured to introduce on the HP the terminal identification information of the facsimile 1, failure information or maintenance information of the relevant facsimile 1, information indicating time and date when the service-

person is available and information related to new-product guide information. Thus, the manager can easily obtain the failure information and the maintenance information (e.g., counts of the counter and elapsed  
5 years) of the facsimile 1 and information indicating time and date when the service-person is available. Also, it is possible to consider purchasing of the new-products by referring to the maintenance information.

Further, when the replenishment of the  
10 consumables is complete or when the maintenance/repair of the resource is complete, an e-mail informing the completion is sent from the facsimile 1 to the service center 18. The service center 18 is configured such that the messages on the HP informed from the manager  
15 are deleted upon sending the e-mail. Therefore, by accessing to the HP of the service center 18, the manager can easily be aware of the fact that an operation on the facsimile 1 has completed.

Further, the present invention is not limited  
20 to these embodiments, and variations and modifications may be made without departing from the scope of the present invention.

The present application is based on Japanese  
priority application No. 2001-011837 filed on January 19,  
25 2001, the entire contents of which are hereby

incorporated by reference.
